Chat Transcript: Loan EMI Calculator Testing

Date: Sunday, 18 October 2026 (Asia/Karachi) **Participants:** Arslan (user), Claude (assistant)
Subject: Testing https://iarslandogar.github.io/Loan-calculator/ as a first-time user, with an Excel test report

> This transcript lists the messages in order. Claude's tool actions are summarised in [Action] lines; screenshots and raw tool output are not included.

Arslan — 23:34

> can you run testing as nvioce user on this?
> Loan EMI Calculator
> Ask me if you have any questions

Claude

I'll test the Loan EMI Calculator as a first-time, non-technical user would, poking at it in your Chrome and noting anything confusing or broken.

[Action] Loaded the Chrome browser tools and opened the calculator in a new Chrome tab. The first screenshot timed out, so Claude read the page's text and its form controls instead.

Arslan (sent while Claude was working)

> also, prepare a detailed test report as well in excel. with proper test cases you perform

Claude

Noted — I'll log every case I run and deliver it as an Excel test report at the end. The screenshot timed out, so I'll read the page structure directly first.

[Action] Set up a three-step task list: run tests → build the Excel report → check the report.

[Action] Clicked Calculate with every field empty. All three fields showed clear errors.

Claude

Empty-field validation works well. Now the happy path: Rs 1,000,000 at 12% for 5 years (expected EMI ≈ Rs 22,244.45).

[Action] Typed 1000000 / 12 / 5. The red error states cleared while typing.

Claude

Errors clear as I type. Next I'll press Enter (as many novices would) instead of clicking Calculate.

[Action] Pressed Enter. The result was EMI Rs 22,244.45, total interest Rs 334,666.81, a 60-month schedule ending at Rs 0.00, and the entry was saved automatically.

Claude

EMI matches the standard formula. Let me double-check the schedule totals independently, then run a batch of edge-case inputs.

[Action] Recalculated the EMI separately (22,244.4477) and checked that the yearly principal adds up to exactly 1,000,000.

[Action] Ran 50+ input cases covering amount, rate and tenure: commas (1,000,000 and 10,00,000), "10 lakh", "Rs 500000", "1e6", zero and negative values, the minimum and maximum limits, decimal places, "12%", "12,5", 0% to 75% rates, 0 to 1,200 months, "2.5" and "5.0" years, and blank or space-only fields.

[Action] Rechecked every EMI the app gave with 50-digit precision. All matched, including the largest allowed amount (1,000,000,000,000,000).

[Action] Tested saved calculations: they stay after a page reload, they are capped at 20, back-to-back repeats are merged, Restore works, Delete has no undo, and "Clear all" has a working confirmation (Cancel and Esc both close it).

[Action] Tested the "inputs changed" notice, switching currency (PKR to USD), Reset, dark theme, keyboard-only use, a 375 px phone-width view, accessibility attributes and the browser console (no errors).

[Action] Found that at phone width the result appears below the screen after tapping Calculate, so the user sees no change.

[Action] Clean-up: cleared all saved calculations made during testing, set theme back to System and currency back to PKR, and closed the test tab.

[Action] Built the Excel report (4 tabs). The formulas recalculated with no errors, and the summary counts and Calculation Check tab were verified.

Claude

I tested the calculator in your Chrome as a first-time user would. It's ready to use, with one issue worth fixing before you share it widely.

Every monthly payment it gave me was correct. I checked 16 cases against Excel's PMT formula and all matched, including 0% interest, a 1-month loan, a 100-year loan and the largest amount it allows. Error messages are clear and specific, and it accepts friendly formats like `10,00,000`, `1,000,000` and `12%`. Old results disappear as soon as you change an input. Of the 65 test cases, 48 passed, 14 passed with a small note and 3 failed. There are no serious bugs.

Worth fixing (medium):

- **D-01:** On a phone, tapping Calculate puts the result below the screen and the page doesn't move, so it looks like nothing happened. I tested this by shrinking the page to phone width inside desktop Chrome, so check it on a real phone.

Small fixes:

- A tenure of `5.0` is rejected as "not a whole number". Someone who types `2.5` years isn't told to switch to Months instead.
- **Saved calculations:**
  - The list keeps only the last 20, and older ones disappear without any message.
  - Delete has no undo, and the next card moves under the cursor, so a double-click deletes two.
  - The same loan can be saved twice.
- After Restore, the page lands partway down, with the monthly payment scrolled out of view.
- Inputs like `10 lakh`, `Rs 500000` or `12,5` get a plain "must be a number" message with no example of what to type.
- **Cosmetic:**
  - The Calculate button's pale colour looks disabled.
  - A 100-year loan says "Interest is 100.0% of the first payment" when it's really 99.999%.
  - Saved entries write "1200 months" without the comma the results use.
  - The browser tab has no icon.

The Excel report has a Summary tab, the full test cases, a list of every issue with steps to reproduce and a suggested fix, and the accuracy check. The counts on the Summary tab update if you change a test's status. I cleared the saved calculations my tests created and set theme and currency back to System and PKR.
